

EaglesEye — Business Scenarios & Market Map

Every way this industry makes money, who buys, what they need, and where EaglesEye should strike first

Version 1.0 · 10 Aug 2026 · Research grounded in web sources (listed at the end) + industry knowledge · Figures marked (est.) are estimates to validate in sales conversations

1. The industry in one picture

Fleet telematics revenue flows through four layers. You can play in any or all of them:

Layer	What is sold	Typical economics	EaglesEye position
Hardware	GPS devices, sensors, dashcams, installation	One-time: \$50–\$500/vehicle globally; Chinese GT06-class units \$15–40 in MENA (est.)	Deliberately NOT our business — "bring your own hardware" is the wedge; installer partners sell it
Connectivity	SIMs / data plans	\$1–3/vehicle/month (est.)	Not our business (AS-03) — customer or installer procures
Software (SaaS)	The platform: tracking, trips, alerts, reports, API	US/EU: \$25–45/vehicle/month; MENA reality: \$3–10/vehicle/month (est.) — volume compensates	Core business
Services & data	Compliance filing, integration projects, driver coaching, insurance data	Project fees or rev-share	Phase 2+ upsell on top of the data spine

Market context: Saudi fleet management alone is ~\$280–420M (2025) growing 9–15%/yr; Egypt is projected at ~14% CAGR. Growth is driven by e-commerce logistics, fuel-cost pressure, and — critically for you — **government mandates** (§4).

2. Customer segment catalog — who buys and why

Sixteen segments, each tagged with when EaglesEye can serve it: **NOW — Phase 1** **SOON — Phase 2** **LATER**
— Phase 3+

2.1 Distribution & last-mile delivery **NOW**

WHO

FMCG distributors, e-commerce couriers, food/beverage delivery fleets, pharma distributors. 10–300 vans and light trucks. Egypt/Gulf are dense with them.

PAINS

"Where is my driver?", unauthorized side-trips and fuel burn, delivery-time disputes with customers, vehicles used after hours.

THEY NEED

Live map, trip history with trustworthy km (payroll/fuel reconciliation), geofences on customer sites (arrival proof), after-hours movement alerts, simple reports.

NOTES

Exactly the BRD's target persona. Fast sales cycle (owner decides), price-sensitive, high referral density. **This is the classic beachhead.**

2.2 Heavy trucking & general cargo **NOW**

WHO

Cement, steel, aggregate haulers; import/export truckers; 20–500 heavy trucks.

PAINS

Fuel theft (their #1 cost), long-route deviations, driver hours, **and now regulatory mandates** (Egypt traffic-law GPS amendment; Saudi Wasl for >3.5t; Abu Dhabi Asateel).

THEY NEED

Phase 1 covers tracking/trips/geofences; fuel sensors are Phase 2; **compliance connectors (Wasl/Asateel data push) are the Phase 3 item that regulation may pull forward.**

NOTES

Mandates convert "nice to have" into "must buy by deadline" — the cheapest customer acquisition that exists.

2.3 Contracted passenger transport & staff buses **NOW**

WHO

Companies bussing employees (factories, call centers, tourism), B2B shuttle operators. Big sector in Egypt (compounds→offices) and Gulf (labor transport).

PAINS

Route compliance, speeding with passengers aboard, proof-of-service to the paying corporate client, after-hours use.

THEY NEED

Live map shared with the corporate client (viewer role!), speeding alerts, route geofences, punctuality reports. Phase 1 RBAC covers the "give my client a read-only view" trick — a real differentiator.

2.4 School transport **SOON**

WHO

Private schools and school-bus operators. Gulf: regulated (Asateel covers school buses in Abu Dhabi).

PAINS

Parent anxiety ("where is the bus?"), stop compliance, driver behavior with children aboard.

THEY NEED

Phase 1 tracking + a **parent-facing app/notifications** (Phase 2 — separate client surface) and student check-in (RFID) later. Sales via school administrations; longer cycle but sticky and premium-priced.

2.5 Construction equipment & heavy machinery **NOW**

WHO

Contractors and equipment owners: excavators, loaders, cranes, generators. Gulf mega-projects; Egypt's construction boom.

PAINS

Theft (equipment worth \$50k–500k), idle burn, knowing engine-hours for maintenance, machines "borrowed" between sites.

THEY NEED

Position + geofence (site boundaries) + ignition/engine-hours + battery-disconnect alerts — all Phase 1. Utilization and maintenance scheduling are Phase 2. Lower message rates, higher per-asset price tolerance (est. 2–3× a van).

2.6 Equipment & vehicle rental / leasing **NOW**

WHO

Car rental firms, equipment rental yards, leasing companies (banks' fleets under finance).

PAINS

Where is my asset, is the renter abusing it, repossession on missed payments, cross-border movement, usage-based billing evidence.

THEY NEED

Tracking, geofence (allowed zone), speeding/abuse alerts, odometer/engine-hours for billing — Phase 1. Remote immobilization (relay control) is a Phase 2 device-command feature via Traccar's command support.

2.7 Cold chain & reefer transport **SOON**

WHO

Food distribution, pharma logistics, supermarket chains' fleets.

PAINS

Spoiled cargo = lost money + lost contracts; proof of temperature for audits (pharma GDP compliance); door-open events.

THEY NEED

Everything in Phase 1 **plus temperature sensor ingestion, threshold alerts, and temperature reports** — a thin Phase 2 layer over our attributes bag (Traccar already decodes temp sensors on Teltonika IO). Premium pricing; strong differentiation vs cheap portals.

2.8 Field services & sales forces **NOW**

WHO

Maintenance crews (elevators, ACs, telecom towers), medical reps, utility contractors — car/van fleets 10–100.

PAINS

Visit verification ("was the technician actually at the client?"), route efficiency, private use of company cars.

THEY NEED

Geofence visit reports (dwell time at client sites = visit proof) — Phase 1 FR-GEO-05 is literally this. Job dispatch is Phase 3; don't lead with it.

2.9 Waste management & municipal services **SOON**

WHO

Private waste contractors serving cities/compounds; street-cleaning fleets.

PAINS

Proving route completion to the municipality (payment depends on it), missed pickups, fuel.

THEY NEED

Route/geofence compliance reports (Phase 1) + often government-tender requirements (certified reports, sometimes camera). Sales cycle is tender-driven — slower, but contracts are large and multi-year.

2.10 Taxis, minibuses & ride fleets **NOW**

WHO

Taxi cooperatives, minibus owners' associations, small ride-hailing fleet partners (Uber/Careem fleet owners run 10–200 cars).

PAINS

Egypt's traffic-law amendment now mandates GPS for taxis and minibuses; fleet partners fight driver fraud and vehicle abuse.

THEY NEED

Cheap, simple tracking + the compliance checkbox. Price floor of the market (est. \$2–4/vehicle/month) — win on volume and self-service, not features. Good filler, poor beachhead.

2.11 Tourism transport **NOW**

WHO

Nile cruise transfer fleets, Red Sea resort shuttles, tour bus operators. Egypt-specific strength.

PAINS

Safety reputation (accidents make international news), long-standing government tracking requirements for tourist transport, client-facing punctuality.

THEY NEED

Speeding/driver alerts, live view for operations, trip logs for the Ministry of Tourism. Phase 1 fits; Arabic-first UI matters here.

2.12 Oil & gas / mining contractors **LATER**

WHO

Contractors serving fields and mines (Gulf, Western Desert). Strict HSE regimes.

PAINS

IVMS (in-vehicle monitoring system) is contractually REQUIRED by operators (Aramco, ADNOC...): harsh braking/acceleration, seatbelt, fatigue, certified reports.

THEY NEED

Accelerometer-grade driver behavior + certifications + auditor-ready reports — Phase 2 safety scoring at minimum, plus formal IVMS certification per operator. Premium prices; heavy compliance lift. Park it until the platform matures.

2.13 Agriculture LATER

WHO

Large farms (Egypt's reclaimed-land agribusiness), tractor/harvester owners.

THEY NEED

Hours, field coverage maps, fuel. Niche protocols and low connectivity; weak willingness to pay locally (est.). Opportunistic only.

2.14 Trailers & non-powered assets SOON

WHO

Trucking firms tracking trailers separately; container/chassis owners.

THEY NEED

Battery-powered trackers reporting sparsely (1–24 pings/day). Mostly works in Phase 1 (device health must tolerate sparse reporting); pairing trailer↔truck is a small Phase 2 feature.

2.15 Insurance (usage-based / recovery) LATER

WHO

Motor insurers and banks (financed vehicles) wanting tracking as a condition or a discount driver; stolen-vehicle recovery services.

THEY NEED

Driver scoring data (Phase 2), APIs (Phase 1!), recovery workflows. In MENA this is partnership-driven, not product-driven — a distribution channel to court once you have volume, not a first customer.

2.16 Resellers & installers (the channel AS a customer) SOON

WHO

Hardware importers and installation workshops who sell devices but have no software of their own — today they resell Wialon/Navixy white-labels.

PAINS

Foreign platforms priced in USD/EUR per device, no Arabic-first UX, no local support, data abroad.

THEY NEED

White-label EaglesEye: their logo, their customers, wholesale per-device pricing. **Our AO-01/AO-02 (tenant hierarchy + branding fields) was designed for exactly this.** One reseller = tens of end fleets — the multiplier that lets a solo founder scale sales without a sales team.

3. Cross-cutting use-case scenarios

These are the "jobs to be done" that cut across segments — the language customers actually use:

Scenario	Trigger to buy	EaglesEye today?
Where is everything right now	Owner's baseline anxiety	Yes — live map
Trustworthy km for payroll/fuel	Driver disputes, fuel reconciliation	Yes — trips (2% odometer goal via OSRM pending)
After-hours / unauthorized use	"My van was in another city on Friday"	Phase 1 alerts (T-7xx upcoming)
Theft recovery	One stolen vehicle pays for years of subscriptions	Yes — live tracking + power-cut alert (upcoming)
Site arrival/departure proof	Customer disputes, SLA billing	Yes — geofences (T-6xx upcoming)
Speeding & safety	Accidents, insurance, HSE contracts	Phase 1 speeding alerts; scoring Phase 2
Fuel theft detection	#1 cost leak in trucking	Phase 2 (fuel sensors) — most-requested upsell
Temperature compliance	Spoiled cargo, pharma audits	Phase 2 thin layer (sensors decode already)
Regulatory compliance	Egypt GPS law, Wasl, Asateel deadlines	Tracking yes; official data-push connectors Phase 3 (pull forward if sales demand)
Maintenance by km/hours	Breakdowns, warranty	Phase 2 (odometer/engine-hours data already flows)
ERP integration	IT departments, larger fleets	API foundation Phase 1; connectors Phase 3

4. Regulatory tailwinds — MENA's gift to you

This is the single most important commercial fact in this document: all three of your target markets now have GPS mandates. Regulation creates deadline-driven buyers who must purchase something — the question is only from whom.

Market	Mandate	Who must comply	Opportunity for EaglesEye
Egypt	Traffic-law amendment requiring GPS trackers	Heavy trucks, taxis, minibuses	Home-market wave of first-time buyers; be the Arabic-first, locally-supported option

Saudi Arabia	Wasl platform (TGA): approved GPS pushing location/speed/ignition $\leq 30s$ intervals	Commercial vehicles $> 3.5t$, buses, logistics	Phase 3 Wasl connector = market entry ticket; partner with a KSA-certified provider earlier
UAE (Abu Dhabi)	Asateel platform, ITC-approved devices	Freight, passenger buses, school buses	Same pattern; certification needed before entry

Caveat: certification (device + platform) is a real barrier in KSA/UAE — plan it as a Phase 3 project with a local partner. Egypt's regime is younger and looser: verify the implementing regulations' exact requirements (open question for your lawyer alongside T-108).

5. Business models — how EaglesEye charges

Model	Mechanics	When
Direct SaaS	Per vehicle per month, tiered (Track / Operate / Comply). MENA benchmarks (est.): \$3–5 basic, \$6–10 with alerts+reports, premium verticals 2–3 $\times$. Annual prepay discounts.	Phase 1 — the pilot model
White-label / reseller	Wholesale per-device price to installers/resellers (\$1.5–3/mo est.); they own the customer and margin. Tenant hierarchy + branding already in the schema.	Phase 3 UI, but pilotable manually earlier
Compliance package	Base SaaS + certified mandate connector at premium; deadline-driven sales	Phase 3 (Egypt first)
Module marketplace — your "IaaS" vision	Client enables and pays for exactly the modules they need: base tracking + toggles for cold-chain, maintenance, safety, parent-app, ERP connector... Architecture already supports it: modules are event-bus consumers (AO-03), so a "module" = a consumer + UI pages + a billing flag per tenant. Later still: dedicated single-tenant deployments for enterprises ("deploy what they need" literally).	North star for Phase 2+ packaging — design pricing around modules from day one
Integration services	Paid ERP/ops integrations on top of the public API	Opportunistic from Phase 1 API
Data products	Anonymized mobility/insurance scoring data	Far future; requires scale + legal care

6. Competitive landscape — who you actually fight

Tier	Players	Reality for you
Global integrated	Samsara, Motive, Geotab, Verizon Connect (\$25–45+/veh/mo)	Not your fight — they ignore SMB MENA and force their hardware; their pricing is your umbrella

White-label platforms	Wialon (Gurtam), Navixy, GpsGate, GPSWOX	The real competition — most regional "providers" are resellers of these. Your edge: own stack (no per-device platform fee to a vendor), Arabic-first, modern API, local data residency. Their edge: 10+ years of protocol maturity — which the Traccar bridge neutralizes
Regional providers	Cartrack ME, Location Solutions, Sicuro (UAE); Land-Fleet and dozens of small portals (Egypt)	Fragmented, aging UX, weak APIs — exactly the "weak local portals" the BRD targets. Compete on product quality + support
DIY / open source	Self-hosted Traccar (free)	The tech-savvy fleet's option. Your answer: EaglesEye is the managed, multi-tenant, Arabic, supported product — and you know Traccar better than they do

7. Where to strike first — scored and ranked

Scoring 1–5 for a solo founder in Egypt with a working Phase-1 platform and no capital:

Segment	Phase-1 fit	Sales access	Willingness to pay	Regulatory push	Verdict
Distribution / last-mile	5	4	3	2	BEACHHEAD #1 — the BRD pilot persona; referral-dense
Heavy trucking (Egypt)	4	3	4	5	BEACHHEAD #2 — mandate deadline sells for you
Staff/passenger transport	5	3	4	3	BEACHHEAD #3 — client-viewer trick differentiates
Construction equipment	4	3	4	1	Strong 4th — theft stories close deals
Rental / leasing	4	3	4	1	Good — immobilization ask comes fast
Field services	5	3	3	1	Good filler; small fleets
Tourism transport	4	3	3	3	Egypt niche worth one reference client
Taxis / minibuses	5	2	1	5	Volume game later; self-service needed
Cold chain	3	2	5	2	First Phase-2 vertical — premium prices
School transport	3	2	4	3	Needs parent app (Phase 2)
Resellers (white-label)	3	3	4	2	THE scale channel — court from day one, sell manually first
Waste / municipal	4	2	3	3	Tender-driven; slow
Oil & gas IVMS	2	1	5	4	Park until Phase 2+ certifications

Recommended play: pilot with **one distribution fleet** (proves the product) + **one trucking fleet facing the Egyptian mandate** (proves compliance value) — both match BG-01's "two pilots". Keep **one installer/reseller** relationship warm (DP-02 requires it anyway) as the future white-label channel. First Phase-2 investment: **fuel + temperature sensors** — they unlock trucking premium and cold chain, the two highest willingness-to-pay upsells.

What NOT to do: don't chase oil & gas IVMS, government tenders, or KSA/UAE certification before you have Egyptian reference customers — each is a 6–12 month distraction with certification/relationship barriers. And don't compete on price against Wialon resellers at the taxi floor of the market; you'll win those on self-service volume later or not at all.

8. What this means for the roadmap

- **Phase 1 as planned serves beachheads 1–3.** The alerts engine (T-7xx) and geofence events (T-6xx) are the two unfinished pieces those sales conversations will hit first — they outrank everything else now.
- **Sensor ingestion (fuel, temperature) should be the first Phase-2 commitment** — it doubles addressable premium segments with modest work (the attribute pipeline already carries them).
- **The module-marketplace ("client deploys what they need") vision shapes packaging now:** keep every new capability behind a per-tenant flag from birth (the settings service is the natural home), so "modules" become sellable units without re-architecture.
- **Compliance connectors** (Egypt first) deserve a research spike when the implementing regulations publish — being early to a mandate is a land-grab.
- Sales materials needed before client meetings: a one-page Arabic pitch per beachhead scenario (say the word and I'll draft them).
